## Supplementary Information Titles

Please list each supplementary item and its title or caption, in the order shown below.

Note that we do NOT copy edit or otherwise change supplementary information, and minor (nonfactual) errors in these documents cannot be corrected after publication. Please submit document(s) exactly as you want them to appear, with all text, images, legends and references in the desired order, and check carefully for errors.

## Supplementary Information

## Supplementary Figure 1 Binding specificity, in vitro inhibitory function and epitope

 mapping of PfCSP monoclonal antibodies.a, Binding of varying concentrations of PfCSP antibodies isolated from plasmablasts to rPfCSP by ELISA. b, Effect of PfCSP antibodies on primary hepatocyte infection by PfSPZ in vitro. Infection rate was determined by enumeration of liver-stage parasites or exoerythrocytic forms (EEF) present at day 3.5 post infection and normalized by expressing as a fraction of untreated controls. Antibody concentrations are as shown, (bars represent mean EEF Fraction +/- one standard deviation). c, Binding specificity of PfCSP antibodies to rPfCSP, N-, Repeat, or Cterminal domains of PfCSP by ELISA. Controls: 2A10, a mouse antibody specific for the repeat region of $\operatorname{PfCSP}{ }^{22,23}$, and 5D5, a mouse antibody specific for the N terminus of $\operatorname{PfCSP}^{37}$. $\mathbf{d}$ and $\mathbf{e}$, Binding of antibodies to overlapping peptides of PfCSP. (Right) Applies to $\mathbf{d}$ thru $\mathbf{g}$, with specified amino acid sequences numbered 20-61 and color-coded representing overlapping peptides spanning the repeat region of PfCSP (residues 97-276). Peptides 28-41 and 46-60
consisted only of NANP repeats and are represented by peptide 29. f and $\mathbf{g}$, Binding of PfCSP antibodies to rPfCSP in the presence of varying concentrations of peptides. Peptide color code as in d. Data are representative of two $(\mathbf{b}, \mathbf{c})$ or three $(\mathbf{a}, \mathbf{d}-\mathbf{g})$ independent experiments.

## Supplementary Figure 2 Apparent affinity of PfCSP antibodies by biolayer interferometry.

Avidity of PfCSP antibodies to: a, rPfCSP; b, Peptide 21; c, Peptide 29. Antibody binding curves are shown in black (raw data). Data were fitted (dotted red lines) with the binding equations describing a 1:1 heterologous ligand interaction. Serial concentrations of antibodies used are displayed on the panels of antibody CIS34. ( $n=2$, representative experiment is shown).

## Supplementary Figure 3 Isothermal Titration Calorimetry (ITC) analysis of PfCSP antibodies.

Binding of PfCSP antibodies to rPfCSP or peptides. a, CIS23, CIS34, CIS42, mAb10. b, Binding of CIS43 to peptides 21 and 29. c, Binding of mAb10 to PfCSP mutant (PfCSPP102A/D103N). Changes in the junctional epitope is depicted in red and highlighted in yellow. Upper panels show the output signal, $\mathrm{dQ} / \mathrm{dt}$, as a function of time. Lower panels show the integrated heats as a function of the antibody-site/rPfCSP molar ratio in the cell. The solid line represents the result from best non-linear least-squares fit of the data to a binding model that takes into account one or two sets of sites with different affinities. Dissociation constant (Kd), changes in Gibbs energy $(\Delta \mathrm{G})$ of binding, enthalpy $(\Delta \mathrm{H})$ and entropy $(-\mathrm{T} \Delta \mathrm{S})$ and stoichiometry (N) are shown. Data are representative of two independent experiments (a-c).

Supplementary Figure 4 Crystal structures of CIS43 antigen-binding fragment in complex with PfCSP peptides and structural explanation for peptide 21 scanning mutagenesis. a, Surface representation of CIS43 antigen-binding fragment (light chain in wheat and heavy chain in light blue) with peptide $20,21,25$, and 29 shown in sticks and colored as indicated. $\mathbf{b}$, Surface representation of CIS43 antigen-binding fragment with $2 \mathrm{Fo}-\mathrm{Fc}$ map shown at $1 \sigma$ around peptide 21, with peptide removed for visualization, with hydrophobic residues (glycine, alanine, valine, leucine, isoleucine, proline, phenylalanine, methionine, and tryptophan) shown in orange and electrostatics. c, Ranking and structural explanation of peptide 21 alanine variants based on competition results from Fig. 3c. d, Structural visualization of the mutations. X indicates loss of hydrogen bonding when mutating the residue.

## Supplementary Figure 5 Binding specificity and functional capacity of antibody CIS43 variant (CIS43v).

a, Amino acid sequence alignment of heavy chain variable regions of CIS43 and CIS43v. Mutations are shown in red. b, Binding of varying concentrations of CIS43 (solid lines) and CIS43v (dashed lines) to peptide 21 (magenta) and to rPfCSP (grey) by ELISA. Data are representative of two independent experiments. $\mathbf{c}$, Binding free-energy changes $(\Delta \Delta \mathrm{G})$ of CIS43v antigen-binding fragment to peptide 21 were calculated for each individual mutation as well as for the four combined mutations. d, Effect of CIS43v on primary human hepatocyte infection by PfSPZ in vitro. Infection rate was determined as described in Fig. 2. Bars represent mean EEF $+/$ - one standard deviation. Data are from one experiment for CIS43v (d).

## Supplementary Figure 6 Crystal structures of CIS42 antigen-binding fragment in complex with PfCSSP peptides.

a, Surface representation of CIS42 antigen-binding fragment (light chain in wheat and heavy chain in light green) with peptide 21 in magenta sticks representation and $90^{\circ}$ rotation with view down towards the combining sites. Top row, surface representation of CIS42 antigen-binding fragment with peptides shown as sticks: peptide 21 (magenta), peptide 20 (green), peptide 25 (yellow) and peptide 29 (cyan). Bottom row, surface representation of CIS42 antigen-binding fragment with 2 Fo-Fc electron density map shown at $1 \sigma$ around peptide 21 , with peptide removed for visualization, with hydrophobic residues (glycine, alanine, valine, leucine, isoleucine, proline, phenylalanine, methionine, and tryptophan) shown in orange and electrostatics. b, (Left) Details of the interactions of CIS42 antigen-binding fragment with the peptides. Antibody residues within $5 \AA$ of the peptides are shown as sticks for the light (wheat) and heavy (light green) chains when bound to peptide 21, and as green, yellow and cyan for peptides 20, 25 and 29, respectively. (Right) Superposition of the peptides shown as sticks and colored as in a with sequences observed in electron density. c, Details of the interactions between peptide 21 and CIS42 antigen-binding fragment. Peptide 21 is shown in magenta as sticks representation. The CIS42 epitope is shown as sticks and semi-transparent surface with the residues colored based on the CDR regions for light chain in shades of wheat and for heavy chain in shades of green. d, Sequence of CIS42 antigen-binding fragment following Kabbat numbering with residues that contact each peptide shown as open star for side chains only, closed circle for main chain only and closed star for both main and side chains, colored under the sequences as in a. e, Sticks representation of peptide 21 (magenta) in the conformation bound to CIS42 antigen-binding fragment with superposition of three type-I $\beta$-turn NPNA repeat
structures of PfCSP as described in Ghasparian et al. ${ }^{33}$. Each NPNA repeat is labeled and shown in different colors for clarity. RMSD in $\AA$ is indicated over the total number of atoms used in the alignment.

## Supplementary Figure 7 Structural comparison of peptide 21 bound to CIS43 and CIS42 antigen-binding fragments.

a, (Left) Side-by-side structural comparison of peptide 21 which adopts a different conformation when bound to CIS43 antigen-binding fragment (magenta) or CIS42 antigen-binding fragment (light pink) (residues do not align). (Right) $90^{\circ}$ rotation showing the antibodies in transparent surface underlining a different angle of approach when binding to the peptide. b, Peptide 21 (magenta when bound to CIS43 antigen-binding fragment and light pink when bound to CIS42 antigen-binding fragment) aligned on the core NPN residues (residues 107-109) repeat region and angle of approach of the antibodies.

## Supplementary Figure 8 Molecular Dynamics (MD) Simulations.

a, RMSD for CIS43 antigen-binding fragment bound to peptide 21 over 500 nanoseconds (ns) of MD. CIS43 antigen-binding fragment heavy and light chain were used to align the trajectories. CIS43 antigen-binding fragment is depicted in indigo; full peptide 21 (residues 101$111)$ is depicted in plum; residues 107-109 in grape; and residues 101-103 in lavender. b, RMSD of CIS42 antigen-binding fragment bound to peptide 21 over 500 ns of MD, calculated the same as in a. CIS42 antigen-binding fragment is depicted in dark green; full peptide 21 (residues 101-113) is depicted in forest green; residues 107-109 in mint; and residues 101-103 in lime. c, RMSF of 500 ns of free peptide 21 beginning from its CIS43 antigen-binding fragment
conformation (depicted in magenta circles and a solid line) and RMSF of free peptide 21 beginning from its CIS42 antigen-binding fragment conformation (depicted in magenta squares with a dotted line). d, CIS43 and CIS42 antigen-binding fragment crystal structures aligned to their 500 ns frames respectively. Color key for CIS43 antigen-binding fragment: crystal heavy chain shown in purple and crystal light chain shown in gold; 500 ns heavy chain shown in lavender and 500 ns light chain shown in khaki. Color key for CIS42 antigen-binding fragment: crystal heavy chain shown in dark green and crystal light chain shown in sandy brown; 500 ns heavy chain shown in bright green and 500 ns light chain shown in yellow. e, Hydrogen bonding analysis of peptide 21 in complex with CIS42 and CIS43 antigen-binding fragments over 500ns compared to the respective crystal structures. Hydrogen bonds were calculated between peptide residues and the antigen-binding fragment binding interface. Numbers in parentheses indicate bonds present in the crystal structure. f, Principal component analysis (PCA) of 500 ns of free peptide 21 colored by the number of times specific conformations occur. PC 1 is plotted on the x -axis and PC2 is plotted on the y-axis. Crystal structures of peptide 21 in CIS42 and CIS43 antigen-binding fragment conformations are labeled with gray arrows. The top ten eigen values from the PCA analyses are listed in the table. $n=50,000$.

## Supplementary Figure 9 Structural repeat motif analysis.

Phi and Psi angles $\left({ }^{\circ}\right)$ for residues N/D, P, N and A/V of the repeat motif for a, PfCSP peptides bound to CIS43 antigen-binding fragment; $\mathbf{b}$, PfCSP peptides bound to CIS42 antigen-binding fragment; $\mathbf{c}$, Average plus/minus one standard deviation for $\mathbf{a}$ and $\mathbf{b}$; and $\mathbf{d}$, Crystal structure of NPNA determined by Ghasparian et al. ${ }^{33}$. The alignment of the repeat motif peptide, based on the crystal structures as described in Fig. 4 and Supplementary Fig. 6, are shown as
indicated. The NPN repeat motif occurrences are underlined under the sequences. Highlighted in red are the notable outliers for which Phi and/or Psi is $60^{\circ}$ different compared to others in the same row. For peptides bound to CIS43 antigen-binding fragment, this difference is in the first A/V, leading to a repeating structure of NPNA-NPNA; for peptides bound to CIS42 antigenbinding fragment, this difference is with N2 (the Asn following the Pro), leading to a repeating structure of ANPN-ANPN. We note that the Phi, Psi angles for the $1^{\text {st }}$ occurrence of the NPN repeat in peptide 29 bound to CIS43 differs from the rest as shown in Fig. 4.

## Supplementary Figure 10 Western blot used in Figure 5.

Concentrations $(\mu \mathrm{g} / \mathrm{ml})$ of monoclonal antibodies are indicated on top of the autoradiograph. Pulse, Chase, mAb15 (human anti-C terminus PfCSP antibody used as negative control); 5D5 (mouse anti-N terminus PfCSP antibody used as positive control for cleavage of PfCSP on PfSPZ); 43 (CIS43). Molecular mass is indicated in kilodaltons on the left side of the autoradiograph.

## Supplementary Figure 11 Peptide 21 sequence conservation.

a, Complete PfCSP sequence of NF54 strain (clone 3D7). Central repeat region (in black) is flanked by the N - (blue) and C- (green) terminal regions, the leader (grey) and GPI anchor (orange) sequences. Boxed in magenta is peptide 21 sequence which occurs at the junction of the N - and Repeat regions. RI sequence is in brown letters. b, Peptide 21 sequence variation among laboratory and field isolates. Each residue within NF54 peptide 21 sequence is depicted with its position on top. Non-synonymous single nucleotide polymorphisms (SNPs) or indels leading to amino acid coding changes are shown with their respective frequencies, and geographic
locations. c, Pie chart representing frequencies of peptide 21 amino acid conservation shown in b (see URLs) ${ }^{36,39-42}$.

## Supplementary Table 1 PfCSP Immunoglobulin V-gene family usage.

Supplementary Table 2 Biolayer interferometry kinetics of PfCSP antibodies binding to rPfCSP, Peptide 21, or Peptide 29.

Supplementary Table 3 Data collection and refinement statistics for CIS43 antigen-binding fragment.

Supplementary Table 4 Details of the interactions of CIS43 antigen-binding fragment with peptides 20, 21, 25, and 29 (from Pisa web server).

Supplementary Table 5 Data collection and refinement statistics for CIS42 antigen-binding fragment.

Supplemenatary Video 1: Molecular dynamics simulation of free peptide 21, 500ns.
Simulation of free peptide 21 beginning from its CIS43-bound conformation. Peptide residues
101-111 are shown. Residues $\mathrm{Asn}_{107}, \mathrm{Pro}_{108}$, and $\mathrm{Asn}_{109}$ are colored in a gray backbone. Carbon atoms are depicted in cyan, nitrogen atoms in blue, and oxygen atoms in red.

## Supplemenatary Video 2: Molecular dynamics simulation of peptide 21 bound to CIS43

 antigen-binding fragment, 500 ns .The CIS43 antigen-binding fragment heavy chain is shown in purple and the light chain is shown in yellow. Key residues on the antigen-binding fragment involved in hydrogen bonding are shown in ball-and-stick: four amino acids on the heavy chain $\left(\right.$ Ala $_{33}, \operatorname{Arg}_{58}$, Leu ${ }_{95}$, and Leu98 $)$ and one on the light chain $\left(\mathrm{Tyr}_{92}\right)$. Peptide residues $101-111$ are shown in pink. Residues $\mathrm{Asn}_{107}$, $\mathrm{Pro}_{108}$, and $\mathrm{Asn}_{109}$, which have been shown to be essential for binding, are colored in a gray
backbone. Carbon atoms are depicted in cyan, nitrogen atoms in blue, and oxygen atoms in red.

## Supplemenatary Video 3: Molecular dynamics simulation of peptide 21 bound to CIS42 antigen-binding fragment, 500 ns .

The CIS42 antigen-binding fragment heavy chain is shown in green and the light chain is shown in gold. Key residues on the antigen-binding fragment involved in hydrogen bonding are shown in ball-and-stick: four amino acids on the heavy chain $\left(\operatorname{Thr}_{31}\right.$, Asn $_{52}, \mathrm{Tyr}_{98}$, and Gly99) and one on the light chain ( $\mathrm{Ser}_{27}$ ). Peptide residues $101-111$ are shown in pink. Residues $\mathrm{Asn}_{107}, \mathrm{PrO}_{108}$, and $\mathrm{Asn}_{109}$, which have been shown to be essential for binding, are colored in a gray backbone. Carbon atoms are depicted in cyan, nitrogen atoms in blue, and oxygen atoms in red.

## Supplementary Figure 11 Peptide 21 sequence conservation.

a, Complete PfCSP sequence of NF54 strain (clone 3D7). Central repeat region (in black) is flanked by the N - (blue) and C- (green) terminal regions, the leader (grey) and GPI anchor (orange) sequences. Boxed in magenta is peptide 21 sequence which occurs at the junction of the N -and Repeat regions. RI sequence is in brown letters. b, Peptide 21 sequence variation among laboratory and field isolates. Each residue within NF54 peptide 21 sequence is depicted with its position on top. Non-synonymous single nucleotide polymorphisms (SNPs) or indels leading to amino acid coding changes are shown with their respective frequencies, and geographic locations. c, Pie chart representing frequencies of peptide 21 amino acid conservation shown in $\mathbf{b}$ (see URLs) ${ }^{38-42}$.

## Supplementary Figure 10 Western blot used in Figure 5.

Concentrations ( $\mu \mathrm{g} / \mathrm{ml}$ ) of monoclonal antibodies are indicated on top of the autoradiograph. Pulse, Chase, mAb15 (human antiC terminus PfCSP antibody used as negative control); 5 D 5 (mouse anti- N terminus PfCSP antibody used as positive control for cleavage of PfCSP on PfSPZ); 43 (CIS43). Molecular mass is indicated in kilodaltons on the left side of the autoradiograph.

Supplementary Figure 9 Structural repeat motif analysis.
Phi and Psi angles $\left({ }^{\circ}\right)$ for residues N/D, P, N and A/V of the repeat motif for a, PfCSP peptides bound to CIS43 antigenbinding fragment; $\mathbf{b}$, PfCSP peptides bound to CIS42 antigen-binding fragment; $\mathbf{c}$, Average plus/minus one standard deviation for $\mathbf{a}$ and $\mathbf{b}$; and $\mathbf{d}$, Crystal structure of NPNA determined by Ghasparian et al ${ }^{33}$. The alignment of the repeat motif peptide, based on the crystal structures as described in Fig. 4 and Supplementary Fig. 6, are shown as indicated. The NPN repeat motif occurrences are underlined under the sequences. Highlighted in red are the notable outliers for which Phi and/ or Psi is $60^{\circ}$ different compared to others in the same row. For peptides bound to CIS43 antigen-binding fragment, this difference is in the first $A / V$, leading to a repeating structure of NPNA-NPNA; for peptides bound to CIS42 antigen-binding fragment, this difference is with N2 (the Asn following the Pro), leading to a repeating structure of ANPN-ANPN. We note that the Phi, Psi angles for the 1st occurrence of the NPN repeat in peptide 29 bound to CIS43 differs from the rest as shown in
Fig. 4.

Supplementary Figure 8 Molecular Dynamics (MD) Simulations.
a, RMSD for CIS43 antigen-binding fragment bound to peptide 21 over 500 nanoseconds (ns) of MD. CIS43 antigen-binding fragment heavy and light chain were used to align the trajectories. CIS43 antigen-binding fragment is depicted in indigo; full peptide 21 (residues 101-111) is depicted in plum; residues 107-109 in grape; and residues 101-103 in lavender. b, RMSD of CIS42 antigen-binding fragment bound to peptide 21 over 500 ns of MD, calculated the same as in a. CIS42 antigen-binding fragment is depicted in dark green; full peptide 21 (residues 101-113) is depicted in forest green; residues 107-109 in mint; and residues 101-103 in lime. c, RMSF of 500 ns of free peptide 21 beginning from its CIS43 antigen-binding fragment conformation (depicted in magenta circles and a solid line) and RMSF of free peptide 21 beginning from its CIS42 antigen-binding fragment conformation (depicted in magenta squares with a dotted line). d, CIS43 and CIS42 antigen-binding fragment crystal structures aligned to their 500 ns frames respectively. Color key for CIS 43 antigen-binding fragment: crystal heavy chain shown in purple and crystal light chain shown in gold; 500 ns heavy chain shown in lavender and 500 ns light chain shown in khaki. Color key for CIS42 antigen-binding fragment: crystal heavy chain shown in dark green and crystal light chain shown in sandy brown; 500 ns heavy chain shown in bright green and 500 ns light chain shown in yellow. e, Hydrogen bonding analysis of peptide 21 in complex with CIS 42 and CIS 43 antigen-binding fragments over 500 ns compared to the respective crystal structures. Hydrogen bonds were calculated between peptide residues and the antigen-binding fragment binding interface. Numbers in parentheses indicate bonds present in the crystal structure. f, Principal component analysis (PCA) of 500 ns of free peptide 21 colored by the number of times specific conformations occur. PC1 is plotted on the $x$-axis and PC2 is plotted on the $y$-axis. Crystal structures of peptide 21 in CIS42 and CIS43 antigen-binding fragment conformations are labeled with gray arrows. The top ten eigen values from the PCA analyses are listed in the table. $n=50,000$.

[^0]:    * Statistics for the highest-resolution shell are shown in parentheses. Fab, antigen-binding fragment.

[^1]:    * Statistics for the highest-resolution shell are shown in parentheses. Fab, antigen-binding fragment.
